Which contract price supports this invoice?

Prooflane gives accounts payable reviewers a way to trace a price dispute and hand it over with the evidence intact.

Live demo · https://45.76.92.198/

The review records which invoices count

Eight invoices arrive with two unresolved contract matches.

INV504 Two effective contract versions overlap. The reviewer selects C2R.

INV506 No supplied contract covers the invoice date. The reviewer records the reason for exclusion.

7 of 8 included

The exported packet keeps both decisions and their sources.

A disputed price changes three invoices

Case	Inputs	Positive variance
Original	Supplied contract prices	$768.00
Shared price	C1 at $80	$368.00
Price and volume	C1 at $80, INV501 at 80 units	$568.00

Declared bounds put the total between $148.00 and $1,993.00.

Confirming C1 removes at least $645 of that range, given these bounds.

The Vultr VM controls each execution

Public HTTPS and Docker verified. Live Inference verified.

Disposable Docker

Executes bounded Python
Returns output, then is removed

Vultr Serverless Inference

The server requests a Python plan. Invoice rows go to the offline container.

The evidence survives the demo

Evidence	What the independent verifier reconstructs
Sources	Dated contract matches, selections and exclusions
Calculations	Original and alternative results, exact ranges and priorities
Integrity	Receipt links and packet hashes

A false priority value was rejected even after its hash was recomputed.

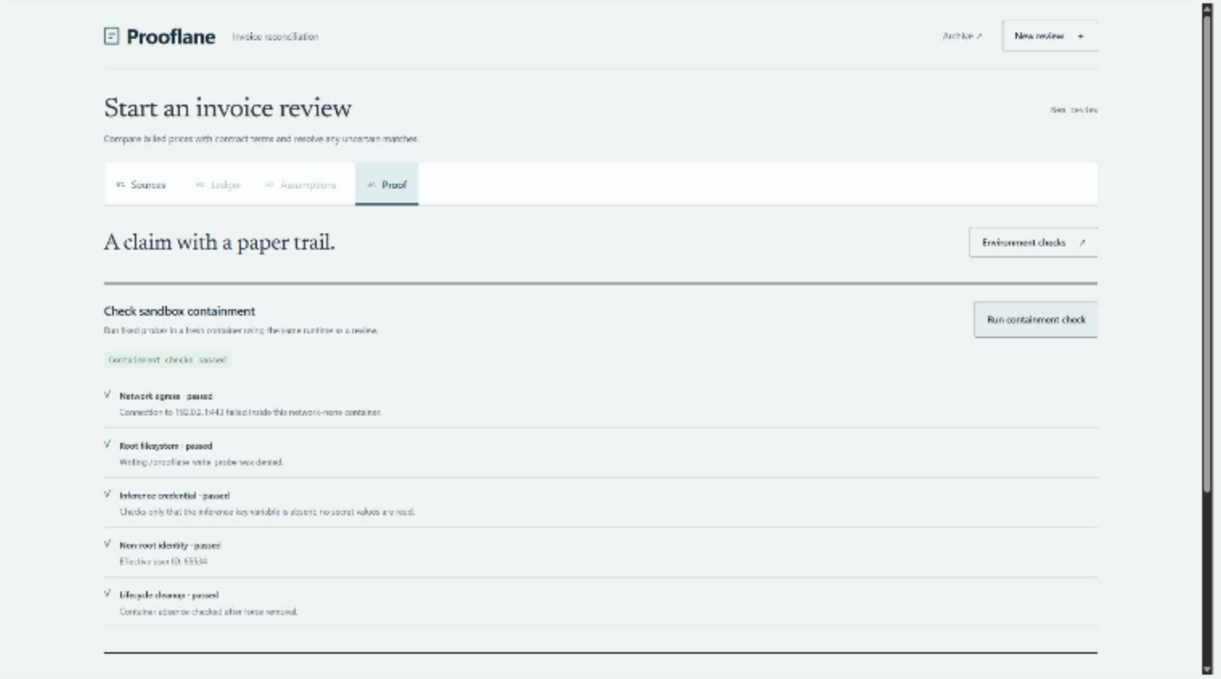

```
python scripts/verify_receipt.py prooflane-case.json
```

Prooflane fits disputed supplier prices

Start with AP teams that already export invoice and contract tables.

Reviewers can prioritize which contract to confirm and send the case to procurement.

Next validation: time how long a second reviewer takes to reproduce an exception using a spreadsheet or a Prooflane packet.

Vultr containment check: 5 observed checks passed
