Test one assumption. Keep both receipts.

An invoice review. One proposed change.
Both results, with exact source-linked deltas.

Vultr Agent Rush · Blast Radius Zero

Inspect the source. Propose one change.

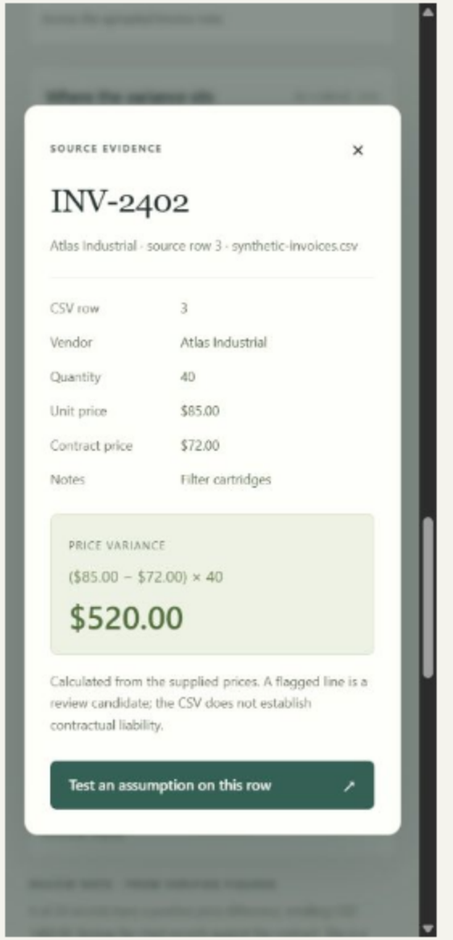

INV-2402 · source row 3

Supplied contract price

$72.00 → $80.00

Original row variance: ($85 − $72) × 40 = $520
Scenario row variance: ($85 − $80) × 40 = $200

The original row and its receipt stay unchanged.
The proposed price is a hypothetical assumption.

The effect of one changed assumption

Measure	Original	Scenario	Change
Total price variance	$1,480.00	$1,160.00	−$320.00
Source row 3 variance	$520.00	$200.00	−$320.00
Total billed	$34,353.00	$34,353.00	$0.00
Flagged lines	6	6	0

23 other source records unchanged

Both runs used the fixed Docker recipe locally. Fictional inputs; this is a hypothetical change in variance, not savings.

Planned Vultr deployment

Local controller and Docker verified. Vultr deployment and inference pending.

Review source rows
Propose one assumption

→

Vultr VM

Original + scenario control plane
Independent Decimal verifier

→

Docker sandbox

Execute bounded Python
Return output; remove container

Vultr Serverless Inference

Agent mode writes code through the server.
Credentials stay outside the sandbox.

No network or host mounts · non-root · read-only root · memory, process, time and output limits · cleanup

Both receipts, one verifiable comparison

Evidence	What is checked	Boundary
Original receipt	Input, code, output hashes Recomputed row arithmetic	Preserves the original Does not prove prices are true
Scenario + original	Exactly one declared cell change Parent receipt and same mode	Checked together in packet Hypothetical assumption
Comparison packet	Both receipts and every delta Offline independent verifier	Integrity and arithmetic No issuer or host attestation

python scripts/verify_receipt.py comparison.json

A reviewer can check the downloaded packet without an account or access to the running application.

Local evidence and remaining gates

Verified locally

83 Python tests passed
24 synthetic HTTP cases passed
36 scenario smoke assertions passed
Real Docker runs and cleanup

Still to prove

Live Vultr Inference behavior
Dedicated Vultr VM deployment
Public judge access
Customer need and workflow value

Next demonstration

Repeat the original → assumption → comparison flow on Vultr; verify the exported packet independently.
